

Assignment 1 – Event Signup

Description

Build a small **Event Signup** feature using an **ASP.NET Core Web App (Model–View–Controller)** project template. The system will allow users to visualize a list of events, display the list of attendees for each event, and signup attendees to a specific event.

Requirements

- Create a new project using the **ASP.NET Core Web App (Model–View–Controller)** template.
- Implement assignment features in separate controller(s)/view(s). Keep the template code for Home and Privacy components.
- Add a link to the Event Manager view in the existing menu.
- Implement the Controller passing data via ViewData and View(model).
- Event Manager page must display all events with a **Manage Attendees** button for each one.
- Events are hardcoded in the Controller to simulate database persistence.
- Define the minimal Domain Models (see below) and use them in Controller and View.
- Manage Attendees page should:
 - display event name.
 - find the event using LINQ/lambda (e.g., FirstOrDefault).
 - have a signup form to register attendees.
 - display attendees list.
- No databases or client frameworks (e.g., JavaScript).
- No edits/deletes for events or attendees. You are allowed to, if you wish, for practice. No marks will be deducted if you try and cannot complete.

Models

Here are the minimum expected attributes. You may add simple validation and/or extra fields but keep it simple.

1. **Event**
 - int Id
 - string Title
 - DateTime Date
 - string Location
 - List<Attendee> Attendees
2. **Attendee**
 - string Name
 - string Email

Sample Output

Deliverables

- Create a new GitHub repository and push your code to GitHub.
- Deploy your website to Windows Azure.
- Submit both links to Brightspace.

Grading Scheme

Criteria	Points
Project Setup (MVC Template, link added)	2
Models	5
Controller	15
Event Manager page (with proper data passing)	3
Manage Attendees page (with proper data passing)	5
GitHub repository	2
Azure deployment	3
Total	35
